Divide the base of one loop of the curve into $(n + 1)$ equal parts, so that the angle equivalent to the linear distance between any two points of division will be $\frac{2\pi}{n+1}$. The ordinate at the (x) -th point of $n + 1$ division will then be $180 \cdot 180 e^{-a} \sin \left(\frac{2\pi x}{n+1} \right)$, $\cos \frac{2\pi x}{n+1}$. If similar equations are formed for the ordinates at each point of division, there result n equations of the first degree, by means of which the constants, a, v, b, c , to n terms can be determined. The general solution for any pair of coefficients, such as a_m and b_m , takes the form $2r \cdot \frac{1}{180} \cdot \frac{1}{180} (l) + e^{TM(kmr)} + -\sin (ww-i)$ The significance of these equations from the graphical standpoint can be seen by referring to Fig. 2, which represents in polar coordinates the curve of Fig. 1. Here the original $(n + i)$ equal linear divisions are replaced by the $(n + i)$...
