Excerpt from Branch and Bound Methods for Combinatorial Problems The difficulty of the problem is entirely computational since the number of tours (i.e. Feasible solutions) is finite. Enumeration of all tours, however, would be a discouraging process for a problem of any appreciable size. There are (n-l)! Tours. Doubling the size of a problem from 5 to 10 cities multiples the number of tours by about 15 thousand; doubling from 10 to 20 cities, by about 250 billion. To put the branch and bound algorithm in perspective, we report briefly on other approaches to the traveling salesman problem. Several methods have been developed for finding a good but not necessarily optimal tour. One of these is random search. Since any permutation of the first n integers can be interpreted as a tour, it is an easy matter to generate a tour by a random process, evaluate its cost, and compare it to the best of any previously developed solutions. Since these steps can be performed quickly, a large number of tours can be generated, and the best one will usually be ...

## Reviews

This published pdf is fantastic. Sure, it really is enjoy, continue to an amazing and interesting literature. I found out this publication from my dad and i suggested this pdf to learn. -- Burdette Buckridge

I just started off reading this article publication. It is definitely simplistic but surprises in the 50 percent of your ebook. You are going to like how the author create this publication.
