*I actually started off looking over this publication. Indeed, it really is play, nevertheless an amazing and interesting literature. Its been printed in an exceedingly basic way and is particularly just right after i finished reading this ebook by which actually altered me, affect the way i believe.*

One equation then between two unknown quantities admits of an infinite number of solutions; but if we have as many different equations, as there are quantities, the number of solutions will be limited. Thus, while each of the equations  $x = 10 - 2y$ ,  $4x + 4 = 3y$ , separately considered, is satisfied by an infinite number of pairs of values of  $x$  and  $y$ , there will only be found one pair common to both, viz.  $x = 2$ ,  $y = 4$ , which are therefore the roots of the pair of equations,  $x = 10 - 2y$ , and  $4x + 4 = 3y$ . Equations of this kind, which are to be satisfied by the same pair or pairs of values of  $x$  and  $y$ , are called simultaneous equations. If there be three unknowns, there must be three equations, and so on: and moreover, these equations must all be different from one another; i. e. must all express different relations between the unknown quantities. Thus, if we had the equation  $x = 10 - 2y$ , it would be of no use to join with it the equation  $2x = 20 - 4y$  (which is obtained by merely doubling it), or any other, derived, like this, immediately from the former; since this expresses no new relation between  $x$  and  $y$ , but repeats in another form the same...
