Excerpt from Treatise on Magnetism and Electricity, Vol. 1 of 2: During the preparation of the second volume of my Treatise on Absolute Measurements, I became strongly impressed with the desirability of a re-discussion of the whole subject of Electricity and Magnetism from the point of view of action in a medium. Since the publication of that work I have therefore tried to put together a statement which, from the beginning, should regard electric and magnetic forces as existing in a space-pervading medium in which the electric and magnetic energies are stored, and by which they are handed on from one place to another with a finite velocity of propagation. Of course it is impossible to avoid abstractions. We cannot explain the electric and magnetic inductions in the sense of giving the rationale of their production by a mechanical system, but this may not be because we know less of things electric and magnetic than we do of the ordinary dynamical action of material systems, but because the explanation of electrical phenomena must be sought in the solution of those very difficulties which...
