Condition: New. Publisher/Verlag: Springer, Berlin | An Economic Evaluation of Alzheimer's Disease | In the future, as our society becomes older and older, an increasing number of people will be confronted with Alzheimer's disease. Some will suffer from the illness themselves, others will see parents, relatives, their spouse or a close friend afflicted by it. Even now, the psychological and financial burden caused by Alzheimer's disease is substantial, most of it borne by the patient and her family. Improving the situation for the patients and their caregivers presents a challenge for societies and decision makers. Our work contributes to improving the in decision making situation concerning Alzheimer's disease. At a fundamental level, it addresses methodological aspects of the contingent valuation method and gives a holistic view of applying the contingent valuation method for use in policy. We show all stages of a contingent valuation study beginning with the design, the choice of elicitation techniques and estimation methods for willingness-to-pay, the use of the results in a cost-benefit analysis, and finally, the policy implications resulting from our findings. We do this by evaluating three possible programs dealing with Alzheimer's disease. The intended audience of this book are health economists interested in methodological problems of contingent valuation studies, people involved in health care decision making, planning, and priority setting, as well as people interested in Alzheimer's disease. We would like to thank the many people and institutions who have provided their help with this project. | Preface.- List of Abbreviations.- 1 : Introduction.- 1. The contingent valuation method.- 2.
